

GM 20 Group / NADA Meeting Packet

Service Performance Overview

1. Key Idea Shared With the Group

Technician Hour Accountability combined with Menu-Driven Selling. Service operations are managed as a production environment with daily and monthly targets for available versus billed hours. Advisors sell from a structured service menu to drive consistency, increase effective labor rate, and improve hours per RO.

Why It Works:

- Improves billed hours and labor gross
- Creates advisor consistency regardless of staffing
- Reduces unpaid diagnostic time and inefficiencies
- Exposes opportunities early instead of at month-end

2. December Technician Capacity & Efficiency

Technician Schedule: • Monday–Friday: 24 technicians × 9 hours • Saturday: 7 technicians × 6 hours • Sunday: Closed

December Breakdown: • Weekdays: 23 days • Saturdays: 4 days Available Hours Calculation: • Weekdays: $24 \times 23 \times 9 = 4,968$ • Saturdays: $7 \times 4 \times 6 = 168$ **Total Available Hours: 5,136**

Total Billed Hours: 4,167.90

December Efficiency: 81.2%

Service Process Controls

3. Service Menu Usage

Advisors sell from a structured service menu rather than memory. Menus clearly separate maintenance and repair recommendations to support consistent pricing, improve customer understanding, and reduce discretionary discounting.

4. Special Order Parts (SOP) Process

- Advisor adds required special-order parts to the Repair Order (RO).
- Parts department orders all parts listed on the RO.
- A weekly Special Order Parts report is printed and reviewed.
- Once all parts for a customer vehicle have arrived, the report is provided to BDC.
- BDC contacts the customer and schedules the appointment only when all parts are in stock.

This process reduces aging special-order inventory, protects cash flow, improves technician efficiency, and ensures repairs are completed in one visit whenever possible.
